

VIPER DROP-PORT

(patent in process)

Advantages:

- Fast and hands free ejection of case. Case falls out the bottom of the stock into a box etc placed under the gun. No bent necks from hitting the lug rail or flung cases from traditional ejectors. No need for towels or long sandbag style dams to trap your delicate cases from being lost off of the bench
- Very high reliability versus ALL other types of ejector equipped designs. Out of 1000's of test rounds to date, NO malfunctions. No need to worry about how fast the bolt is operated etc. Case drops out at rear stop of bolt travel.
- No ejector is required, therefore no ejector hole is there for the case to extrude into under high pressure. Gravity drops the case out the bottom of the stock. A small (1/2") hole in the bottom is all that is required. Funnel shaped part available to aid installation into stock (not required).
- Utilizes a Remington style extractor for maximum safety. Sako extractor equipped actions may allow for the extractor to be blown out and injure the shooter under case head rupture conditions.
- There is no loss of strength or asymmetric stiffness that is inherent in the forward style micro-port design.

Currently taking orders for delivery at the end of the year. PPC and BR only at this time only. A \$100 deposit will secure your action today.
